

What you need	What we give you
<p>A good backup.</p> 	<p>Our backup and disaster recovery solution takes reliable images of your machine that preserve data, applications, and more as they change over time.</p>
<p>For lots of machines.</p> 	<p>We can monitor your backups on thousands of machines from a single web portal.</p>
<p>And lots of different kinds of machines.</p> 	<p>We offer plenty of options that reflect your IT environment, including servers, desktops, and virtual machines. We even work with Exchange servers.</p>
<p>But the backups can't take up too much space.</p> 	<p>Using our solution, we consolidate all your backup images to keep down the needed space.</p>
<p>And you need to be sure they'll work.</p> 	<p>We are also able to mount your backup images as drives so you can see that they work (and get file-and-folder recovery at the same time).</p>
<p>Then you need to replicate this to somewhere else.</p> 	<p>We can then quickly replicate your images offsite to keep your data safe, whatever the disaster.</p>
<p>..... ⚡ So when a disaster strikes ⚡</p>	
<p>You can get up and running.</p> 	<p>We can run your backup images as virtual machines, so while you're waiting for new hardware, you can keep your business running with a single laptop.</p>
<p>And get your data back quickly.</p> 	<p>Or, we can pre-stage your recovery in a virtual machine so when something goes wrong, you're 95% recovered and can restore with a click of a button.</p>
<p>Regardless of your hardware or the scope of your disaster.</p> 	<p>With our solution you can restore to any machine, whether it's physical or virtual, and regardless of manufacturer or model.</p>
